

PHP/ MySQL: Export/ Import/ Delete Labs

motivation

The Labsystem (<http://labsystem.sourceforge.net/>) is the web-based eLearning system our practical exercises iLab (<http://ilab.net.in.tum.de/>) and iLab² (<http://ilab2.net.in.tum.de/>) are currently running within.

The system is currently lacking a versioning function for its content. We need this functionality to exchange course material and especially improvements in it with other universities that also run the system for the respective courses.

The system is running on a MySQL database and it is written in PHP. As the Import/ Export/ Delete functionality is somehow aside the current system the necessity to understand the existing system's code is limited. Nevertheless the new functionality must be integrated inside the system.

your task

Your task is to implement an Export/ Import and Delete functionality on the database.

A more detailed requirements analysis can be found here:

<http://www.pahl.de/?site=open>

You need experience in MySQL, PHP and SVN.

keywords

eLearning, Versioning, MySQL, CVS, PHP
